

Clusters of missed settlements

Bansara State Supplementary Immunization Activity, 9-13 March 2026 | Getis-Ord Gi* on ward missed rate, Queen contiguity, 9,999 permutations, Benjamini-Hochberg FDR | EPSG:32632 (WGS 84 / UTM zone 32N)

Ward missed rate

- 0% - 5%
- 5% - 10%
- 10% - 15%
- 15% - 20%
- 20% - 25%
- 25% - 30%
- 30% - 35%

- Gi* hot-spot ward (FDR $p < 0.05$)
- LGA boundary
- Missed settlement
- Covered settlement
- Inaccessible (excluded)

Result

3 of 40 wards form a significant cluster of high missed rates after FDR correction. Global Moran's $I = 0.356$, $p = 0.0004$.

3 hot-spot wards 227 settlements
51 missed 31,950 under-5 children

Definition

A settlement is missed when NO doses were reported in the e-tally AND no track confirms a visit. Both sources must agree on absence. 444 of 2,487 analysed (17.9%). 75 security-classified settlements excluded, not counted as missed.

What this does NOT show

Not a statement about any individual settlement: Gi* describes neighbourhoods.
Not a statement about any child - nothing here measures vaccination status.
Not causal: where, not why.
Settlement-level clustering is NOT significant (Moran's $I = 0.003$, $p = 0.34$). The finding is a ward-level finding and does not restate.

Sources and method

GPS tracks: 160 files, 956,702 fixes, of which 150,940 (16.2%) usable after QA.
Settlement masterlist 2,562; e-tally 2,023.
Attribution: 50 m + 2 x reported accuracy.
Visit = 5+ distinct minutes of presence.

Projection EPSG:32632 (WGS 84 / UTM 32N).
Synthetic assessment data - not a real population or programme.
